

Tile Intake Conversion Program

Subsurface intakes (alternative) are tile intakes that use a lateral tile system below the ground instead of the usual upright tile intake to drain surface water from a field.

What are the Benefits of this?

- Sediment and contaminants are eliminated from runoff water before the water enters the surface and groundwater
- Easier farming of fields when the above ground intake is removed.

Funding Available

- Landowners receive 50% of the cost to convert up to a maximum payment of \$500 per year.

You must complete the contract work before the conversions are complete, so start the process early.
